

# Operational Multi-Sensor Oil Spill Surveillance Program

Björn Baschek

Federal Institute of Hydrology (BfG), Germany  
baschek@bafg.de

International Oil & Ice Workshop, Anchorage, October 10, 2007

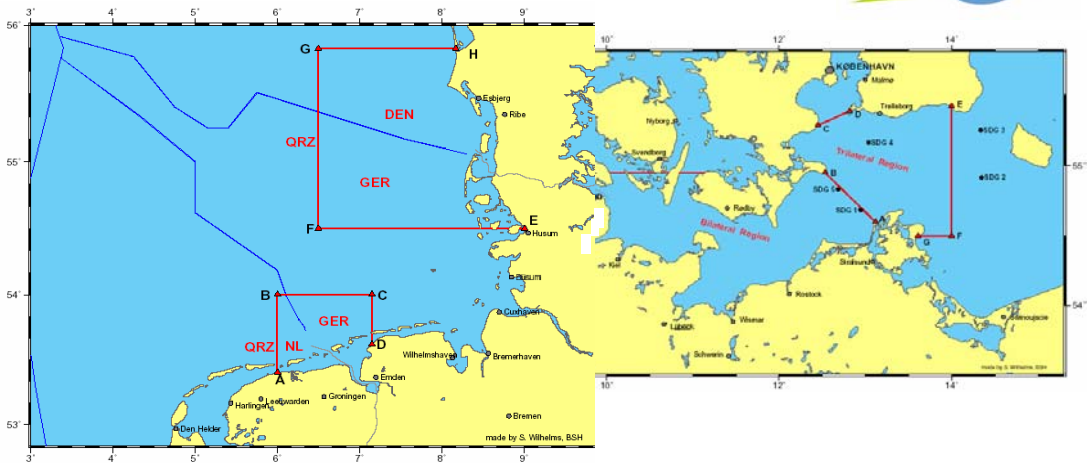

Seite 1

## Content

- Introduction – situation and task
- Combined system
  - aircraft and satellite
- Sensor system of German Do228
  - optimized for oil spill surveillance over water
- Use for oil & ice?
- Summary

## Surveillance area North- & Baltic Sea

- 115.000 km<sup>2</sup> area of responsibility
- Bad weather conditions
- Wadden sea with strong tidal currents & wide tidal range
- Narrow shipping lanes
- Very high traffic density
- Highly populated coastal areas
- Sensitive ecosystem

International Oil & Ice Workshop, Anchorage, October 10, 2007

Seite 3

## TASK: Surveillance for maritime oil pollution

- Co-ordination and optimisation of ship operation during oil spill combat
- 24 h, weather independent surveillance (international agreements Bonn, Helsinki, MARPOL)
- Detection of unintentional & deliberate pollution
- Amount, kind, spatial distribution of pollution
- Verification; collection of evidence

**There are secondary tasks, but aircraft sensor system is optimised for above purposes (over water)**

International Oil & Ice Workshop, Anchorage, October 10, 2007

Seite 4

## Partners & Operation

- Two "DO228" aircraft are equipped with a multi-sensor system (different systems)

**Federal Ministry of  
Transport, Building and  
Urban Development**  
- responsibility

**Central Command for  
Maritime Emergencies  
(CCME)**

- Pollution combat
- Coordinate operational surveillance

**BfG**

- Scientific advisor
- Purchaser / Coordination equipment with sensor system

**German Naval Air  
Wing 3 „Graf  
Zeppelin“ (MFG 3)**  
- Fly / operate / maintain

**Industry**

- build sensor system  
(current phase:  
OPTIMARE)

International Oil & Ice Workshop, Anchorage, October 10, 2007

Seite 5

## Combined system – synergetic effects

### Aircraft:

- Flexible, high resolution routine (+ accident) surveillance
- Pollution combating assistance
- Multi-sensor system: much more information (-> later)
- “Ground” truth; preservation of evidence

### Satellite (oil spill pollution services):

- EMSA & MarCoast (European GMES-project; BfG: user and validation activities)
- SAR only: Indicates possible pollution
- Limited repetition rate, fixed (known) times
- Partly-automatic NRT analysis, first alert; good overview (large area); cheaper image price

### Drift model: Stronger integration planned

ENVISAT: credits to ESA

International Oil & Ice Workshop, Anchorage, October 10, 2007

Seite 6

- Introduction – situation and task
- Synergetic effects
  - aircraft and satellite
- Sensor system of German Do228
  - optimized for oil spill surveillance over water
- Use for oil & ice?
- Summary

## Overview of the sensors on board of German Do228

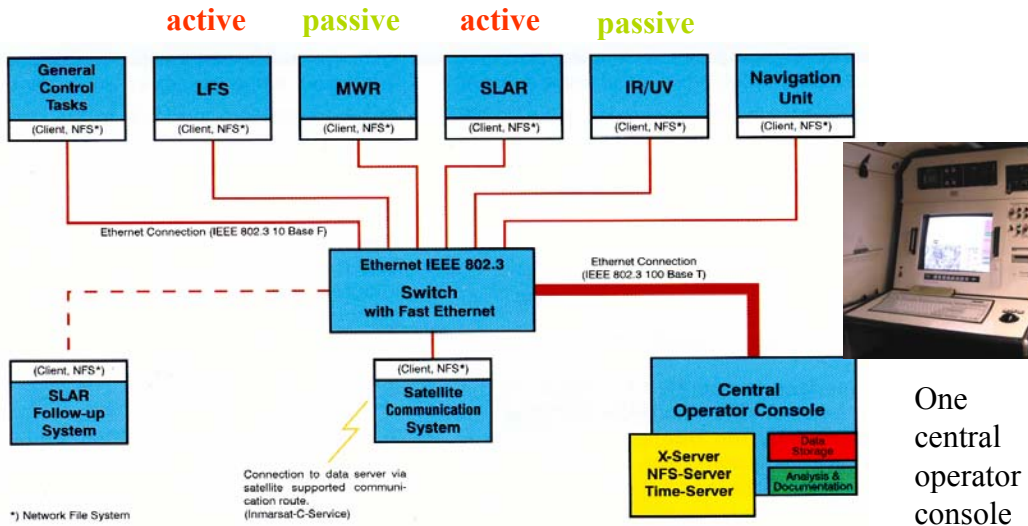

- Wide-range: ( $\pm 30$  km)
  - Detection of position of possible pollution
    - **Sideward Looking Airborne Radar (SLAR)**
- Narrow-range: ( $\pm 250$  m)
  - Oil indicators & Area
    - **SLAR / IR/UV /Laser-Fluoro-Sensor (LFS)**
  - Layer thickness (thick / thin layers)
    - **Microwave-Radiometer (MWR) / LFS**
  - Classification of oil (and chemicals)
    - **LFS**
  - Securing of evidence
    - **Forward Looking Infrared Camera (FLIR); active**
    - **Video system, cameras**
  - Additional support for pollution combating
    - **Communication**

Seite 9

## View inboard

■ Balance between endurance / weight & number sensors

FLIR

Seite 10

# Principle of oil detection by SLAR (Sideward looking airborne radar)

- X-band-waves (ca. 10 GHz) are back-scattered by ships and capillary waves
- Thin oil layers smoothen sea surface roughness
- => reduced backscattering
- => „black“ spots on radar image

= indirect effect

Possible other sources for „dark spots“:

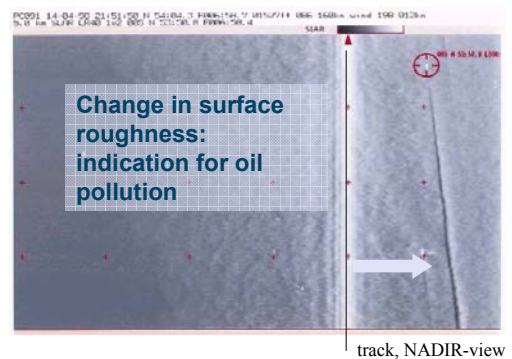

e.g. windless areas, algae, upwelling water, sandbank, fish oil

=> Signal can be misinterpreted (SAR satellite similar)

=> Aircraft near-range sensors required

## SLAR backscatter signal

**Envisat  
ASAR image  
(satellite)  
shows tanker,  
Prestige, 100 km  
off Spanish coast**

International Oil & Ice Workshop, Anchorage, October 10, 2007

Seite 13

**IR/UV – 2 channel line-scanner (passive)**

**IR-Channel**

- Thermal emission of the sea surface (8.5 - 12.5  $\mu\text{m}$ )
- Lower emissivity of oil (than water)  
=> oil layer seems colder than water surface
- However: oil films of thickness  $> 0.5 \text{ mm}$  absorb sunlight,  
=> temperature increases & oil layer appears warmer
- THERMAL REFERENCE:  
Two controllable field-filling blackbody reference sources  
=> absolute (temperature measurement)

- Independent from daylight -> also operating at night

**UV-Channel**

- Measures sun-light reflected from sea surface (320 - 380 nm)
- Very thin oil films ( $> 0.01 \mu\text{m}$ ) can be determined due to short wavelength of the UV
- Limited to daylight conditions and to sufficient visibility

bfg Bundesanstalt für  
Gewässerkunde

Seite 14

## Microwave-Radiometer (MWR)

- Line-scanner (Swath 476m@100ft; 72°)
- Wavelengths (reserved): 18.7, 36.5, 89 GHz
- Atmospheric measurements @ 89 GHz
- Oil layer thickness determination between 50µm to the mm range

Advantage:

- Insensitive to water vapour
- Day and night operability by analysing the thermal microwave radiation

However:

- **High extinction of microwave in water restricts measurements on surface layers.**

International Oil & Ice Workshop, Anchorage, October 10, 2007

## Principle of MWR

- Interferences between boundary layers oil/air and oil/water => oil layer thickness determination (50µm to 3mm)
- Thermal microwave radiation
- Simultaneous measurements of multiple frequencies prevent ambiguousness
- Simultaneous detection of atmospheric radiation for calibration (particularly for rain and rain clouds)

International Oil &amp; Ice Workshop, Anchorage, October 10, 2007

## Laser-Fluoro Sensor (LFS)

- Determination of oil layer thickness within 0.1 to 20  $\mu\text{m}$ ,
- Identification and classification of the oil types

Schematic of the geometrical arrangement associated with a laser fluorosensor.  
International Oil & Ice Workshop, Anchorage, October 10, 2007

- to prevent false alarms:  
discrimination of natural oil alike  
substances on the sea surface and  
of mineral oil,
- Detection of oil quantities below  
the water surface
- Currently alignment problems
- On-sea campaign for sensor testing  
(e.g. LFS) planned for next year

Seite 19

## Setup of the LFS

- Flight height 1000 ft  
typical (eye safe > 300ft)
- ~ 10m pixel to pixel;  
conical scan pattern
- IFOV ~ 1.5 m \* 1,5 m
- Pulsed  
high-energy-laser  
XeCl excimer  
308 nm; 150 mJ
- Photo multiplier
- Dichroitic beam-splitter
- Optical bandwidth ~10 nm
- Interference filter

# Principle of LFS

- Layer thickness: ratio between back-scattered Raman-signal from and outside the oil film,

International Oil & Ice Workshop, Anchorage, October 10, 2007

Seite 21

## Fluorescence measurements of oil species; excitation @ 308nm

- Classification by a principal component analysis of the fluorescence signals
- determination of eigenvalue-spectra / correlation with oil class catalogue

Detection  
wavelengths  
(12 channels)

Fluorescence  
Raman Scattering

International Oil & Ice Workshop, Anchorage, October 10, 2007

Seite 22

# Fusion & comparison of sensors

	Visual	SLAR	UV	IR	MWR	LFS	Satellite (RADARSAT)
Range @ 300m flight altitude	approx. ±3km	wide, ±30km	narrow, ±250m			narrow, ±75m	300x300km
Classification capabilities	no	no			yes	yes	no
sensitivity on oil film thickness	N.A.	N.A.	>0.01 µm	>10 µm	50 µm to 2.5mm	0.1 µm to 20 µm	N.A.
Spatial resolution	high	60m by 30m (perp.)	3.5m	3.5m	>5m	10m pixel-to-pixel distance	50m
Detection of oil spills below surface	no	no			yes	yes	no
Operating at night	no	yes	no	yes	yes	yes	yes
Film thickness determination	Appearance of oil slick	no			yes, 50 µm to 2.5mm	yes, 0.1 µm to 20 µm	no
Measuring geometry	visual	Line-by-line, 20 Hz			Conical, 5Hz	Conical, 5Hz	image
Impaired by	no	no	clouds	clouds	no	clouds, flight altitude	no

- Depending on the sensor there are further limitations e.g. due to size of the spill, weathering state, weather conditions (too much or too little wind)

## Fusion of the sensor data

### Determination of the oil layer extension

IR

UV

### Determination of the oil layer thickness

18 GHz

35 GHz

85 GHz

### classification, thickness of layer

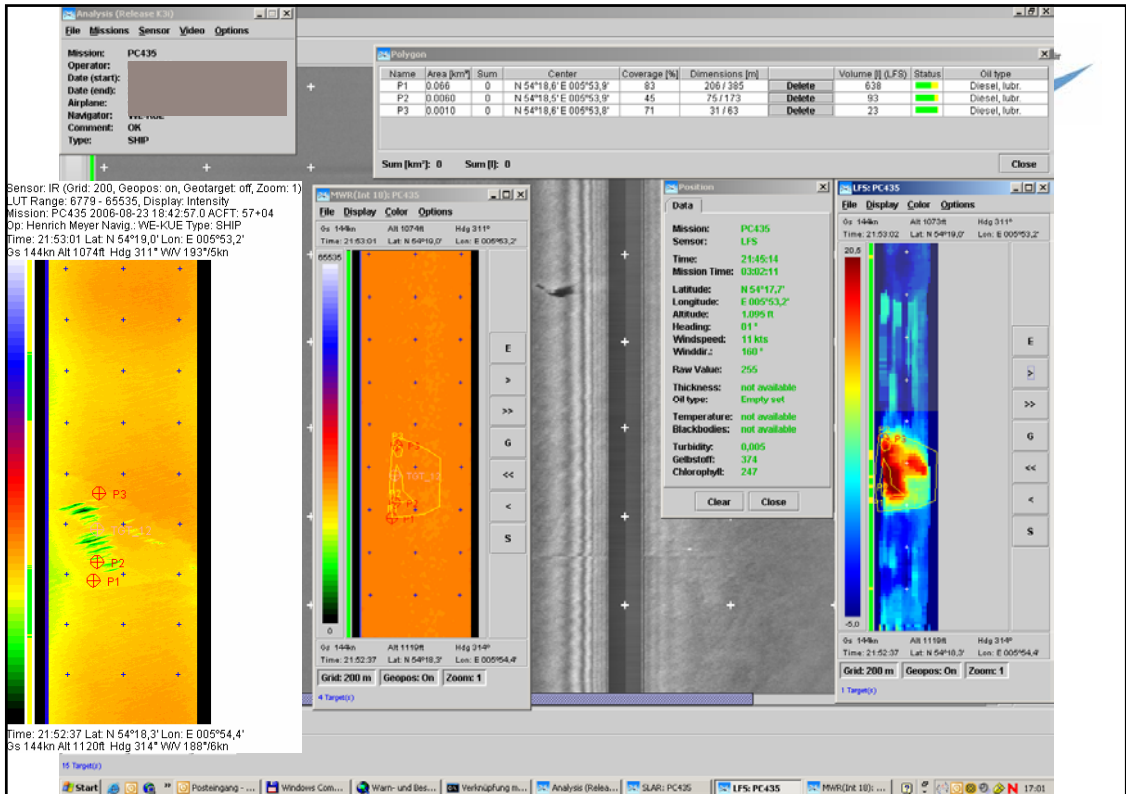

IR

UV

LFS

- Information obtained = combination of all sensors & near real-time on-board analysis (optimised for oil on water)
- All data stored in database => on-ground re-analysis possible

## Some ideas about OIL & ICE – Input for workshop discussion

- System optimized for detecting oil on water
- Suitable for detecting oil on (in / under) ice??
- So far: no experience
- Ice/Oil shows much more possible variations than Water/Oil !
- Some points/ideas for discussion!
- Distinguish between:
  - Physical principle suitable
  - Technical realisation suitable
  - Existing analysis software suitable (database: on-ground re-analysis possible)

## SLAR images of ice

- Needed for finding oil slick -> otherwise like “finding a needle in a haystack”
- Signal of ice similar to signal of land
- Oil ON ice should be possible to detect (area)
- Expected to be difficult to distinguish from water on ice or from smooth ice surface

International Oil & Ice Workshop, Anchorage, October 10, 2007

Seite 27

## UV

- Detection principle based on higher reflectivity of oil compared to water
- => should work similar for oil on ice

## MWR

- Emissivity in microwave regime seems to depend on kind of ice
- But: sensor expected to provide some information about oil & ice

## IR? - Emissivity of ice (grey) and water (black)

- Emissivity of ice and water in IR comparable: detection should be similar, too
- Limit by range of BB for calibration?

Figure based on data from the MODIS UCSB emissivity library (NASA/CFSC/SBRC):

Source of figure:

<http://www.comp.glam.ac.uk/pages/staff/pplassma/MedImaging/PROJECTS/IR/CAMTEST/Icewater.htm>

## LFS – fluorescence of (tap) water and ice

- Strong scattering  
=> smaller layer  
=> weaker fluorescence signal
- Low Raman  
=> limitations on ice!
- Thickness (LFS)  
probably not possible

- Not absolute measurement – water in front of oil needed for calibration and as basis for oil classification (for re-analysis probably ice possible)

## Conclusions and outlook

- Satellite input to aerial surveillance used for alert of potential spills and good overview
- German Airborne multi-sensor system in DO228
  - optimized for oil spill surveillance and detecting oil on **water**
  - Combination of sensors provide – on-board in NRT – a multitude of information
    - e.g. confirmation as oil, area, volume, type
  - Part of information even at night and through clouds
- Oil on ice?
  - so far no experience
  - Sensors & software optimized for use on oil on water
  - There are some limitations (more complex, more difficult detection) but also some potential
  - More would have to be shown by
    - > further theoretical considerations
    - > experiments

-> INPUT? DISCUSSION !
